VCE Chemistry ½
Moles & Molar Mass [2.1]
Homework Solutions

Admin Info & Homework Outline:

Student Name	
Questions You Need Help For	
Compulsory Questions	Pg 2 - Pg 12
Supplementary Questions	Pg 13 - Pg 24

Section A: Compulsory Questions (50 Marks)

Sub-Section [2.1.1]: Apply Avogadro's Number to Mole Calculations using $n = N/N_a$

Question 1 (4 marks)

For the following, find the required value.

- a. If a sample contained 2 moles of H_2 gas, how many particles of H_2 does it contain? (1 mark)

$$2 \times 6.02 \times 10^{23} = 1.204 \times 10^{24} \text{ particles}$$

- b. Given that 9.03×10^{24} molecules of water existed, how many moles of water are in the sample? (1 mark)

$$9.03 \times 10^{24} / 6.02 \times 10^{23} = 15 \text{ moles}$$

- c. How many particles exist in 4.5 moles of CH_4 ? (1 mark)

$$4.5 \times 6.02 \times 10^{23} = 2.709 \times 10^{24} \text{ particles}$$

- d. How many moles are in 1.89×10^{24} molecules of neon gas? (1 mark)

$$1.89 \times 10^{24} / 6.02 \times 10^{23} = 3.14 \text{ moles}$$

Question 2 (3 marks)

Find the number of particles in the following.

- a. In 3 moles of H₂, find the particles of hydrogen. (1 mark)

$$3 \times 6.02 \times 10^{23} \times 2 = 3.612 \times 10^{24} \text{ particles of hydrogen}$$

- b. In 5 moles of NaCl, find the particles of sodium. (1 mark)

$$5 \times 6.02 \times 10^{23} = 3.01 \times 10^{24} \text{ particles of sodium}$$

- c. In 3.06×10^{25} particles of nitrogen in nitrogen gas, find the moles of nitrogen gas. (1 mark)

$$3.06 \times 10^{25} / 2 / 6.02 \times 10^{23} = 25.42 \text{ moles}$$

Space for Personal Notes

Question 3 (6 marks)

 Consider the compound of methane, CH_4 .

- a. If there are 3.01×10^{24} molecules of methane, how many moles of methane are present? (1 mark)

5 moles

- b. How many carbon atoms are there in this amount of methane? (1 mark)

$3.01 \times 10^{24} \times 1 = 3.01 \times 10^{24}$ atoms

- c. How many hydrogen atoms are there in this amount of methane? (1 mark)

$3.01 \times 10^{24} \times 4 = 1.204 \times 10^{25}$ atoms

- d. Given that we have 3.311×10^{24} atoms of hydrogen in a sample of methane, calculate the moles of methane we have in total. (3 marks)

$3.311 \times 10^{24} / 4 = 8.2775 \times 10^{23}$ molecules of methane
 $8.2775 \times 10^{23} / 6.02 \times 10^{23} = 1.375$ moles

Space for Personal Notes

Sub-Section [2.1.2]: Apply Molar Mass to Mole Calculations
using $n = m/M$

Question 4 (4 marks)

For the following substances, find their molar mass.

a. NH_3 . (1 mark)

$$14 + 3 = 17 \text{ g mol}^{-1}$$

b. ZnSO_4 . (1 mark)

$$65.4 + 32.1 + (16 \times 4) = 161.5 \text{ g mol}^{-1}$$

c. KI . (1 mark)

$$39.1 + 126.9 = 166 \text{ g mol}^{-1}$$

d. AgNO_3 . (1 mark)

$$107.9 + 14 + (16 \times 3) = 169.9 \text{ g mol}^{-1}$$

Space for Personal Notes

Question 5 (4 marks)

For the following samples, calculate the amount required.

- a. Given that there is 2.4 g of H₂O, calculate the moles present. (1 mark)

$$2.4/18 = 0.133 \text{ moles}$$

- b. Given that there is 8.1 g of HCl, calculate the moles of hydrogen chloride. (1 mark)

$$8.1/36.5 = 0.222 \text{ moles}$$

- c. Given that there are 2.00 moles of LiF, calculate the mass present. (1 mark)

$$2 \times 26 = 52 \text{ g}$$

- d. Given that there are 4.50 moles of NaNO₃, calculate the mass present. (1 mark)

$$4.50 \times 85 = 382.5 \text{ g}$$

Space for Personal Notes

Question 6 (6 marks)

- a. Explain what molar mass is. (2 marks)

Molar mass is the weight of 1 mole of a particular compound.

- b. Given that a sample contains 5.90 moles and weighs 250.75 grams, what is its molar mass? (2 marks)

$$250.75 / 5.90 = 42.5 \text{ g mol}^{-1}$$

- c. Based on this information, we also know that the compound contains 2 atoms, with one of them being lithium. What is the other atom? (2 marks)

Chlorine. ($42.5 - 7 = 35.5$ which is corresponding to chlorine.)

Space for Personal Notes

Sub-Section [2.1.3]: Apply Unit Conversions to Calculation Questions

Question 7 (4 marks)

For the following, convert the current units to the units required.

- a. 1.30 *kg* to *mg*. (1 mark)

_____ $1.3 \times 10^6 \text{ mg}$ _____

- b. 2 days to minutes. (1 mark)

_____ 2880 minutes _____

- c. 5000 micrograms to grams. (1 mark)

_____ $5.0 \times 10^{-3} \text{ g}$ _____

- d. 100 decimetres to millimetres. (1 mark)

_____ 10,000 mm _____

Space for Personal Notes

Question 8 (4 marks)

Find the missing value for the following questions.

- a. Given that a sample of NaNO_3 weighed 5.00 kg , what is the number of moles present? (1 mark)

$$5000/85 = 58.82 \text{ moles}$$

- b. Given that another sample of AlCl_3 weighed 1260 mg , what is the number of atoms of chlorine present? (3 marks)

$$1260 / 1000 = 1.26 \text{ g}$$

$$1.26 / 133.5 \text{ (molar mass)} = 0.00944 \text{ moles}$$

$$0.00944 \times 6.02 \times 10^{23} \times 3 = 1.70 \times 10^{22} \text{ atoms of chlorine.}$$

Space for Personal Notes

Question 9 (5 marks)

Consider the compound, sodium sulphate.

- a. What is its molar mass? (1 mark)

$$\text{Na}_2\text{SO}_4 \rightarrow 46 + 32.1 + 64 = 142.1 \text{ g mol}^{-1}$$

- b. Given that, a sample contains 5.432×10^{-3} kilograms, what is the number of moles present? (2 marks)

$$5.432 \times 10^{-3} \text{ kg} = 5.432 \text{ g}$$

$$5.432 / 142.1 = 0.03822 \text{ moles}$$

- c. Now, based on your answer, find the mass of sodium in the sample, expressed in micrograms. (2 marks)

$$0.03822 \times 2 = 0.07645 \text{ moles of sodium}$$

$$0.07645 \times 23 = 1.758 \text{ grams} = 1.758 \times 10^6 \text{ micrograms}$$

Space for Personal Notes

Sub-Section: Final Boss

Question 10 (10 marks)

Consider an experiment where the aim is to experimentally determine Avogadro's number using a sample of potassium phosphate.

- a. What is the molar mass of potassium phosphate? (1 mark)

$$212.3 \text{ g mol}^{-1}$$

- b. Calculate the amount of moles of potassium phosphate present, given that the sample weighed out to be 39 mg. (3 marks)

$$39 \text{ mg is } 3.90 \times 10^{-2} \text{ grams}$$

$$0.039 / 212.3 = 1.84 \times 10^{-4} \text{ moles of potassium phosphate}$$

- c. On the other hand, we know that the amount of potassium in the sample was equivalent to $1.966 \times 10^{-5} \text{ kg}$. What is the amount of potassium atoms? For this question, you can use the known value of N_A . (2 marks)

$$1.966 \times 10^{-5} \times 1000 / 39.1 = 0.0005028 \text{ moles} \times 6.02 \times 10^{23} = 3.026 \times 10^{20} \text{ atoms}$$

- d. Given the information above, now find the experimental value of Avogadro's number. (2 marks)

$$3.026 \times 10^{20} \text{ atoms} \times \frac{1}{3} = 1.0089 \times 10^{20} \text{ atoms of potassium phosphate}$$

$$1.0089 \times 10^{20} / 1.84 \times 10^{-4} = 5.48 \times 10^{23} \text{ mol}^{-1}$$

e. Briefly explain why Avogadro's number has the units it does. (2 marks)

It is because individual atoms/compounds do not have units in themselves and so as Avogadro's is saying "the number of particles per mole" it will be written as " mol^{-1} " (per mole).

Space for Personal Notes

Section B: Supplementary Questions (61 Marks)

Sub-Section [2.1.1]: Apply Avogadro's Number to Mole Calculations using $n = N/N_a$

Question 11 (4 marks)

For the following questions, calculate the amount required.

- a. The moles of magnesium atoms in 1.204×10^{24} particles. (1 mark)

2.00 moles

- b. The particles of argon atoms in 19 moles. (1 mark)

1.144×10^{25} particles

- c. The moles of francium atoms in 3.913×10^{24} particles. (1 mark)

6.5 moles

- d. The particles of copper atoms in 9.654 moles. (1 mark)

5.820×10^{24} particles

Space for Personal Notes

Question 12 (4 marks)

Find the number of particles in the following.

- a. In 2 moles of O_2 , find the particles of oxygen atoms. (1 mark)

$$2 \times 6.02 \times 10^{23} \times 2 = 1.204 \times 10^{24} \text{ particles of O}$$

- b. In 4 moles of $CaCl_2$, find the particles of calcium ions. (1 mark)

$$4 \times 6.02 \times 10^{23} = 2.408 \times 10^{24} \text{ particles of calcium}$$

- c. If we knew that a sample of CO_2 contained 1.20×10^{24} particles of oxygen, how many moles of CO_2 were there? (2 marks)

$$1.20 \times 10^{24} / 2 / 6.02 \times 10^{23} = 0.997 \text{ moles}$$

Space for Personal Notes

Question 13 (6 marks)

 Consider the compound of ammonia, NH_3 .

- a. If there are 6.02×10^{24} molecules of ammonia, how many moles of ammonia are present? (1 mark)

10 moles

- b. How many nitrogen atoms are there in this amount of ammonia? (1 mark)

$6.02 \times 10^{24} \times 1 = 6.02 \times 10^{24}$ atoms of N

- c. How many hydrogen atoms are there in this amount of ammonia? (1 mark)

$6.02 \times 10^{24} \times 3 = 1.806 \times 10^{25}$ atoms of hydrogen

- d. Given that we have 4.518×10^{24} atoms of hydrogen in a sample of ammonia, calculate the moles of ammonia we have in total. (3 marks)

$4.518 \times 10^{24} / 3 = 1.506 \times 10^{24}$ molecules of ammonia
 $1.506 \times 10^{24} / 6.02 \times 10^{23} = 2.5$ moles of ammonia

Space for Personal Notes

Question 14 (6 marks)

Consider the compound of KMnO_4 , or commonly referred to as potassium permanganate.

- a. Given that we have 6.41×10^{29} particles of oxygen, what number of particles of manganese and potassium do we have? (2 marks)

Manganese and potassium are both the same at 1.6025×10^{29} particles

- b. Hence, what number of moles of potassium permanganate do we have? (1 mark)

$1.6025 \times 10^{29} / 6.02 \times 10^{23} = 2.66 \times 10^5$ moles

- c. A student says that for 100 molecules of O_2 versus 100 molecules of Se_2 , because Se is a much bigger molecule than O, their amount in moles will be different. Evaluate this statement. (3 marks)

This is false as moles and particles/molecules are related using $n = N/N_A$ and so we use moles as a way to group molecules together and count them more easily instead of using very large individual counting methods. Hence, as it's just used to count molecules/particles 100 molecules of both Se_2 and O_2 will be the same amount of moles. $\left(\frac{100}{6.02} \times 10^{23}\right) = 1.66 \times 10^{-22}$ moles

Space for Personal Notes

Sub-Section [2.1.2]: Apply Molar Mass to Mole Calculations
using $n = m/M$

Question 15 (4 marks)

For the following substances, find their molar mass.

a. CO_2 . (1 mark)

$$12 + 32 = 44 \text{ g mol}^{-1}$$

b. KCl . (1 mark)

$$39.1 + 35.5 = 74.6 \text{ g mol}^{-1}$$

c. CaCO_3 . (1 mark)

$$40.1 + 12 + 48 = 100.1 \text{ g mol}^{-1}$$

d. $\text{C}_6\text{H}_{12}\text{O}_6$. (1 mark)

$$180 \text{ g mol}^{-1}$$

Space for Personal Notes

Question 16 (4 marks)

For the following samples, calculate the amount required.

- a. Given that there is 5.0 g of CO₂, calculate the moles present. (1 mark)

$$5/44 = 0.114 \text{ moles}$$

- b. Given that there is 10.0 g of NaOH, calculate the moles of sodium hydroxide. (1 mark)

$$10/40 = 0.25 \text{ moles}$$

- c. Given that there are 3.00 moles of MgCl₂, calculate the mass present. (1 mark)

$$3 \times 95 = 285 \text{ g}$$

- d. Given that there are 2.50 moles of KNO₃, calculate the mass present. (1 mark)

$$2.50 \times 101 = 252.5 \text{ g}$$

Space for Personal Notes

Question 17 (5 marks)

- a. Given that a sample contains 12.50 moles and weighs 778.75 g, what is its molar mass? (2 marks)

$$778.75 / 12.50 = 62.3 \text{ g mol}^{-1}$$

- b. Based on your understanding of molar mass, is it reasonable to assume that 10 g of NaNO_3 will be similar in amount to 10 g of CsNO_3 ? Explain. (3 marks)

No, because the molar mass of NaNO_3 is 85 g mol^{-1} whereas CsNO_3 is 195 g mol^{-1} . Which means their respective mole amounts would be 0.117 vs. 0.0513, which means that there is double the amount of NaNO_3 compared to CsNO_3 .

Space for Personal Notes

Question 18 (7 marks)

Consider an unknown chemical X_2O . We know that there are 7.89×10^{25} atoms of oxygen in this sample.

- a. What is the number of individual atoms in our sample? (2 marks)

$$7.89 \times 10^{25} \times 3 = 2.367 \times 10^{26} \text{ atoms}$$

- b. Find the moles of X_2O . (2 marks)

$$7.89 \times 10^{25} / 6.02 \times 10^{23} = 131.06 \text{ moles}$$

- c. If the compound is 12345 grams, find its molar mass. (2 marks)

$$12345 / 131.06 = 94.2 \text{ g mol}^{-1}$$

- d. What is X 's identity? (1 mark)

$$94.2 - 16 = 78.2 / 2 = 39.1 \text{ (POTASSIUM)}$$

Space for Personal Notes

Sub-Section [2.1.3]: Apply Unit Conversions to Calculation Questions

Question 19 (4 marks)

For the following, convert the current units to the units required.

- a. Convert 5.50 *kg* to grams. (1 mark)

_____ 5500 grams _____

- b. Convert 3 hours to seconds. (1 mark)

_____ 10800 seconds _____

- c. Convert 7500 milligrams to kilograms. (1 mark)

_____ $7.5 \times 10^{-3} \text{ kg}$ _____

- d. Convert 25 micrometres to metres. (1 mark)

_____ $2.5 \times 10^{-5} \text{ m}$ _____

Space for Personal Notes

Question 20 (4 marks)

Find the missing value for the following scenarios.

- a. Given that a sample of K_2SO_4 weighed 2.50 kg , what is the number of moles present? (1 mark)

$$2.50 = 2500\text{ g}, 2500 / 174 = 14.37\text{ moles}$$

- b. Given that another sample of $CaCl_2$ weighed 980 mg , what is the number of atoms of chlorine present? (3 marks)

$$\begin{aligned}
 980\text{ mg} &= 0.98\text{ g} \\
 0.98 / 111 &= 0.00883\text{ moles} \\
 0.00883 \times 6.02 \times 10^{23} \times 2 &= 1.06 \times 10^{22}\text{ atoms of chlorine}
 \end{aligned}$$

Space for Personal Notes

Question 21 (5 marks)

Consider the compound of calcium bromide.

- a. What is its molar mass? (1 mark)

$$40.1 + 79.9 + 79.9 = 199.9$$

- b. Given that, a sample contains 9.7412×10^{-4} megagrams, what is the number of moles present? (2 marks)

$$\begin{aligned} &974.12 \text{ g} \\ &974.12 / 199.9 = 4.87 \text{ moles} \end{aligned}$$

- c. Now, given that is the case, find the mass of bromine in the sample, expressed in milligrams. (2 marks)

$$\begin{aligned} &4.87 \text{ moles} \times 2 = 9.74 \text{ moles of bromine} \\ &9.74 \times 79.9 = 778.226 \text{ grams of bromine} = 7.78 \times 10^5 \text{ mg} \end{aligned}$$

Space for Personal Notes

Question 22 (8 marks)

 Consider a molecule of $K_2Cr_2O_7$, commonly referred to as potassium dichromate.

- a. What is the molar mass of this molecule? (1 mark)

$$39.1 \times 2 + 2 \times 52 + 16 \times 7 = 294.2 \text{ g mol}^{-1}$$

- b. What type of intramolecular bonding holds this molecule together? (1 mark)

Ionic bonding

- c. If there was 20.3 mg of potassium dichromate present, how many moles of it are present? (1 mark)

$$20.3 \times 10^{-3} / 294.2 = 6.90 \times 10^{-5} \text{ moles}$$

- d. From your previous answer, calculate the number of molecules of potassium dichromate present. (2 marks)

$$6.90 \times 10^{-5} \times 6.02 \times 10^{23} = 4.15 \times 10^{19} \text{ molecules}$$

- e. Now, state how many kilograms of oxygen was present in the sample. (3 marks)

$$4.15 \times 10^{19} \times 7 = 2.908 \times 10^{20} \text{ atoms of oxygen} / 6.02 \times 10^{23} = 6.9 \times 10^{-5} \text{ moles of oxygen} \times 16 = 1.104 \times 10^{-3} \text{ grams of oxygen} = 1.10 \times 10^{-6} \text{ kg}$$
