## VCE Mathematical Methods $\frac{1}{2}$ Linear & Coordinate Geometry [1.1] Workbook

### Outline:

#### Linear Functions and Graphs

Pg 2-6

- Inequality

#### Midpoint and Distances

Pg 7-12

- Midpoint
- Distance Between Two Points
- Vertical Distance VS Horizontal Distance

#### Line Geometry

Pg 13-20

- Parallel and Perpendicular Lines
- Angle Between a Line and the  $x$ -axis.
- Angle Between the Two Lines

#### Simultaneous Equations

Pg 21-30

- Finding Simultaneous Equations for Two Variables
- Number of Solutions For Two Variables

## Section A: Linear Functions and Graphs

### Linear Equations

➤ **Definition:** Equations where the highest power of a variable is 1.

🔄 **Gradient-intercept form:**

$$y = mx + c$$

$$\text{where } m = \text{gradient} = \frac{\text{rise}}{\text{run}} =$$

$$\text{and } c =$$

➤ No singular solution for a linear equation in two variables.

🔄 All pairs of coordinates  $(x, y)$  that satisfy the equation lie on a **line**. (Hence, *linear* equations).

Space for Personal Notes

*Let's have a look at sketching some of these equations.*

### Question 1 Walkthrough.

Sketch the graph of the following linear relations, labelling all axes intercepts.

$$y = 2x - 4$$

### Question 2

Sketch the graphs of each of the following linear relations, labelling all axes intercepts with their coordinates.

$$y = -3x + 5$$

## Sub-Section: Inequality

### Inequalities Rule

$$x > \frac{b}{a}, \text{ where } a < 0$$

➤ Multiplying both sides by a negative number \_\_\_\_\_ the inequality sign.

### Question 3

Solve each of the following for  $x$ :

$$9 - 6x \leq 2$$

Space for Personal Notes

### Exploration: Graphs of Linear Inequalities

- Instead of just representing \_\_\_\_\_ on the Cartesian plane, the graph of a linear inequality represents an entire \_\_\_\_\_  $(x, y)$  which satisfies the inequality.
- **Step 1:** Put the equation into the form of \_\_\_\_\_
- **Step 2:** Sketch the linear **equation**, ignoring the inequality sign.
  - ⚙ If the inequality is inclusive ( $\leq$  or  $\geq$ ), we draw a [solid] / [dotted] line.
  - ⚙ If the inequality is exclusive ( $<$  or  $>$ ), we draw a [solid] / [dotted] line
- **Step 3:** Shade the region either **above** or **below** the line
  - ⚙ If  $y >$  or  $y \geq$ : \_\_\_\_\_
  - ⚙ If  $y <$  or  $y \leq$ : \_\_\_\_\_

### Question 4 Walkthrough.

Sketch the linear inequality  $y - 1 - x \geq 0$  on the axes below.

**Question 5**

Sketch the graphs of each of the following linear inequalities, labelling all axes intercepts with their coordinates, and shading the appropriate regions.

a.  $4x + 2y < -6$

b.  $5x - 2y - 8 \leq 0$

## Section B: Midpoint and Distances

### Sub-Section: Midpoint

**Discussion:** How might we find a midpoint between two points?

#### Midpoint

$$\begin{array}{c}
 (x_2, y_2) \\
 \bullet \\
 \bullet \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right) \\
 \bullet \\
 (x_1, y_1)
 \end{array}$$

➤ **Definition:** The midpoint,  $M$ , of two points  $A$  and  $B$  is the point halfway between  $A$  and  $B$ .

$$M(x_m, y_m) = \left( \quad \quad \quad \right)$$

➤ The midpoint can be found by taking the \_\_\_\_\_ of the  $x$ -coordinate and  $y$ -coordinate of the two points.

Space for Personal Notes

**Question 6**

Find the midpoint between  $(3, -5)$  and  $(-2, 7)$ .

Space for Personal Notes

## Sub-Section: Distance Between Two Points

### Distance Between Two Points

- **Definition:** The distance between two points  $(x_1, x_2)$  and  $(y_1, y_2)$  can be found using Pythagoras' theorem:

$$\text{Distance} = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

*How does this formula work?*

### Exploration: Distance between two points

- Try to construct a Pythagoras' theorem with the three sides above ☺

**Question 7**

Find the distance between  $\left(4, \frac{5}{2}\right)$  and  $\left(-1, -\frac{1}{2}\right)$ .

**Question 8 Extension.**

- a. Find a point(s) on the line  $y = x + 3$  which has a distance of 4 from the point  $(-2, -3)$ .
- b. Give a reason as to why there is more than 1 more point found in **part a**.

**TIP:** Don't hesitate to define a point by letting its  $y$ -value be the function (linear in the above question!)

## Sub-Section: Vertical Distance VS Horizontal Distance

Discussion: How can we find a horizontal distance between two points?

### Horizontal Distance

$$\text{Horizontal Distance} = x_2 - x_1 \text{ where } x_2 > x_1$$

- Find the difference between their  $x$ -values.

### Question 9

Find the horizontal distance between the two points  $(1, 9)$  and  $(13, -4)$ .

*What about vertical distance then?*

### Vertical Distance

**Vertical Distance =  $y_2 - y_1$  where  $y_2 > y_1$**

► Find the difference between their  $y$  values.

### Question 10

Find the vertical distance between the two points  $(1, 9)$  and  $(13, -4)$ .

### Key Takeaways

- ✓ A midpoint is simply an average point.
- ✓ The distance between two points is derived from Pythagoras' theorem.
- ✓ Horizontal distance is simply the difference in their  $x$ -values
- ✓ Vertical distance is simply the difference in their  $y$ -values.

## Section C: Line Geometry

### Sub-Section: Parallel and Perpendicular Lines

Discussion: What do we need for the two lines to be parallel?

#### Parallel Lines

➤ Parallel lines have the \_\_\_\_\_ gradient.

$$m_1 = m_2$$

Space for Personal Notes

**Question 11**

Find a line which is parallel to  $y = 2x - 1$  passing through the point  $(-1,3)$ .

**TIP:** Try to ignore the constant term of the line we must be parallel to. Simply focus on its gradient.

**Discussion:** What about perpendicular lines?

Space for Personal Notes

## Perpendicular Lines

- A line which is perpendicular to another line has a gradient which is the \_\_\_\_\_ of the gradient of the first line.

$$m_{\perp} = -\frac{1}{m}$$

### Question 12

Find a line which is perpendicular to  $y = -3x - 1$  passing through the point  $(5, -1)$ .

Sub-Section: Angle Between a Line and the  $x$ -axis

*How do we find the angle between a line and the  $x$ -axis?*

Angle between a Line and the  $x$ -axis

- The angle between a line and the \_\_\_\_\_ direction of the  $x$ -axis (anticlockwise) is given by

$$\tan(\theta) = m$$

**Question 13 Tech-Active.**

Find the angle made between the line  $y = 2x - 6$  and the  $x$ -axis measured in the anticlockwise direction. Give your answer in degrees correct to two decimal places.

**NOTE:** Angles from the  $x$ -axis measured anticlockwise = \_\_\_\_\_ angles.

- Don't worry about it too much, it's just convention! (More on this in circular functions.)

### How does this formula work?

**Exploration:** Angle between a line and  $x$ -axis.

- Consider a line in the visual below.

- Construct a right-angle triangle with the angle  $\theta$ .
- Consider the opposite and adjacent sides of the right-angle triangle. What can we call them?
- Hence what does  $\tan(\theta)$  equal to given that  $\tan = \text{opposite/adjacent}$ ?

Sub-Section: Angle Between the Two Lines

*Slightly more complicated now!  
How about an angle between two lines?*

Acute Angle Between Two Lines

$$\theta = |\tan^{-1}(m_1) - \tan^{-1}(m_2)|$$

➤ Alternatively:

$$\tan(\theta) = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

For your understanding, note that this formula is derived from the tan compound angle formula covered in SM12.

**NOTE:**  $|x|$  just takes the positive value of  $x$ .

**Question 14 Tech-Active.**

Find the acute angle between the lines  $3x + 2y = 2$  and  $y = \frac{4}{7}x + 1$ . Give your answer in degrees correct to two decimal places.

**TIP:** Make sure your CAS is in degrees.

*Let's see if it's consistent with parallel lines!*

**Exploration:** Understanding parallel lines using the angle between two lines formula

- When two lines are parallel, what must be the angle  $\theta$  between them?

$$\tan(\theta) = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

- Let's substitute the value of  $\theta$  and see what we get!

- This looks rather familiar, doesn't it?

## And now perpendicular lines!

### Exploration: Understanding perpendicular lines using the angle between two lines formula

- When two lines are perpendicular, what must be the angle  $\theta$  between them?

$$\tan(\theta) = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

- Let's substitute the value of  $\theta$  and see what we get! (Note:  $\tan(90) = \text{Undef}$ )

- This looks rather familiar, doesn't it?

### Key Takeaways

- ✓ Parallel lines have the same gradient.
- ✓ Perpendicular lines have a negative reciprocal gradient.
- ✓ The angle between a line and  $x$ -axis is given by  $\tan^{-1}(m)$ .
- ✓ Tangent of the angle between two lines is given by  $\left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$ .
- ✓ The parallel lines and perpendicular lines formula is consistent with the angle between the two lines formula.

## Section D: Simultaneous Equations

### Sub-Section: Finding Simultaneous Equations for Two Variables

#### Simultaneous Linear Equations

##### 1. Elimination Method:

-  Add or subtract one equation from the other in order to \_\_\_\_\_ one of the variables. Then have an equation in one variable that can be solved easily.

##### 2. Substitution Method

-  Make one of the variables the subject (generally  $x$  or  $y$ ) and \_\_\_\_\_ that value into the other equation.

#### **Question 15 Walkthrough.**

Solve the following simultaneous linear equations using either elimination or substitution.

$$2x - y = 8 \text{ and } 2y + 5x = 11$$

**Question 16**

Solve the following equations for  $x$  and  $y$ .

a.  $2x - 5y = 4$  and  $2x + y = 16$

b.  $-3x + 2y = 2$  and  $2 - 2y = x$

**Question 17 Extension.**

Solve the following:

$$-3x + 2y = 10 \text{ and } -10 + y = \frac{3}{2}x$$

Sub-Section: Number of Solutions For Two Variables

*What does the geometry look like for each number of solutions?*

Exploration: Geometry of the number of solutions between linear graphs

➤ Unique Solution

They just need to have \_\_\_\_\_.

➤ Infinite Solutions

$$m_1 = m_2 \text{ AND } c_1 = c_2$$

They just need to have the same \_\_\_\_\_ and the same \_\_\_\_\_.

In other words, they have to be the \_\_\_\_\_.

➤ No Solutions

$$m_1 = m_2 \text{ AND } c_1 \neq c_2$$

They need to have the \_\_\_\_\_ but \_\_\_\_\_  $+c$ .

They have to be two different \_\_\_\_\_ lines.

### General Solutions of Simultaneous Linear Equations

➤ Two linear equations are either:

- ⚙ The same line is expressed in a different form. In this case, they have \_\_\_\_\_ solutions.
- ⚙ Unique lines which are parallel. In this case, they have \_\_\_\_\_ solutions.
- ⚙ Unique lines which are not parallel. In this case, they have \_\_\_\_\_ solution.

### **Question 18 Walkthrough.**

Consider the following pair of simultaneous equations in terms of  $k \in \mathbb{R} \setminus \{0\}$ :

$$y = kx + 5$$

$$y = \frac{2x}{k-1} - 5k$$

- a. Find the value of  $k$  for which there are no solutions to the simultaneous equations.

b. Find the value(s) of  $k$  for which there is a unique solution to the simultaneous equations.

c. Find the value of  $k$  for which there are infinite solutions to the simultaneous equations.

**TIP:** It's a good idea to substitute your answer back into the equations to see if the criteria are met for each part.

Space for Personal Notes

**Question 19**

Consider the following pair of simultaneous equations in terms of  $k \in \mathbb{R} \setminus \{0\}$ :

$$y = \frac{x}{1-2k} - 2k$$

$$y = -kx - 2$$

- a. Find the value(s) of  $k$  for which there is a unique solution to the simultaneous equations.
  
  
  
  
  
  
  
  
  
  
- b. Find the value of  $k$  for which there are infinite solutions to the simultaneous equations.
  
  
  
  
  
  
  
  
  
  
- c. Find the value of  $k$  for which there are no solutions to the simultaneous equations.

Space for Personal Notes

**Question 20 Extension.**

Consider the following pair of simultaneous equations in terms of  $a \in \mathbb{R} \setminus \{0\}$ :

$$ax - 2y = -5$$

$$-3x + (a - 1)y = 5$$

**a.** Find the value(s) of  $a$  for which there are no solutions to the simultaneous equations.

**b.** Find the value(s) of  $a$  for which there is a unique solution to the simultaneous equations.

- c. Find the value(s) of  $a$  for which there are infinite solutions to the simultaneous equations.

Space for Personal Notes

## Contour Check

### Learning Objective: [1.1.1] - Solve and Graph Linear Equations and Inequalities

#### Key Takeaways

- ☐ Linear equations are in the form of  $y = \underline{\hspace{2cm}}$  where  $m$  is the  $\underline{\hspace{2cm}}$  and  $c$  is the  $\underline{\hspace{2cm}}$ .
- ☐ The inequality sign  $\underline{\hspace{2cm}}$  when you multiply by a negative.

### Learning Objective: [1.1.2] - Find Midpoint, Distance (Horizontal & Vertical) Between Two Points Or Functions

#### Key Takeaways

- ☐ Midpoint is simply the  $\underline{\hspace{2cm}}$  of 2 points.
- ☐ Distance formula is derived from  $\underline{\hspace{2cm}}$ .
- ☐ Horizontal distance is the distance between  $\underline{\hspace{2cm}}$  values.
- ☐ Vertical distance is the distance between  $\underline{\hspace{2cm}}$  values.

### Learning Objective: [1.1.3] - Find Parallel and Perpendicular Lines

#### Key Takeaways

- ☐ Parallel lines have the  $\underline{\hspace{2cm}}$  gradient.
- ☐ Perpendicular lines have  $\underline{\hspace{2cm}}$  gradient.

**Learning Objective: [1.1.4] - Find the Angle Between a Line and  $x$  axis or Two Lines****Key Takeaways**

- ☐ To find the angle between a line and the  $x$  axis we can use equation  $m =$  \_\_\_\_\_.
- ☐ To find the angle between two lines we can use  $\theta =$  \_\_\_\_\_ or  $\tan(\theta) =$  \_\_\_\_\_.

**Learning Objective: [1.1.5] - Find The Unknown Value for Systems of Linear Equations****Key Takeaways**

- ☐ Two linear equations have unique solution if they have \_\_\_\_\_ gradients.
- ☐ Two linear equations have infinitely many solutions when they have \_\_\_\_\_ gradient and \_\_\_\_\_ constant.
- ☐ Two linear equations have no solution when they have \_\_\_\_\_ gradient and \_\_\_\_\_ constant.
