Compulsory Questions	Pg 2 – Pg 13
Supplementary Questions	Pg 14 – Pg 22

## Section A: Compulsory Questions

### Sub-Section [2.7.1]: Evaluate Pseudocode with Conditional Statements and Loops

#### Question 1

The following pseudocode segments each print a value. Write down the value that is printed.

a.  $x \leftarrow 5$   
**if**  $x > 3$   
     $x \leftarrow x + 2$   
**end if**  
**print**( $x$ )

---

---

b.  $y \leftarrow 10$   
**if**  $y < 5$   
     $y \leftarrow y - 3$   
**else**  
     $y \leftarrow y + 4$   
**end if**  
**print** ( $y$ )

---

---

c.  $z \leftarrow 1$   
**while**  $z < 4$   
     $z \leftarrow z + 1$   
**end while**  
**print** ( $z$ )

---

---

## Question 2

The following pseudocode segments each print a value. Write down the value that is printed.

a.  $a \leftarrow 3$   
**for**  $i$  **from** 1 **to** 3  
    **if**  $a \leq 5$   
         $a \leftarrow a + 2$   
    **end if**  
**end for**  
**print** ( $a$ )

---

---

---

---

b.  $b \leftarrow 6$   
**while**  $b > 2$   
    **if**  $b$  is even  
         $b \leftarrow b - 3$   
    **else**  
         $b \leftarrow b - 1$   
    **end if**  
**end while**  
**print** ( $b$ )

---

---

---

---

```
c.  $c \leftarrow 1$ 
  for  $j \leftarrow 1$  to 4
    if  $j$  is even
       $c \leftarrow c + 3$ 
    else
       $c \leftarrow c + 1$ 
    end if
  end for
  print ( $c$ )
```

---

---

---

---

Space for Personal Notes

### Question 3

The following pseudocode segments each print values. Write down the values that are printed.

a.  $a \leftarrow 1$   
 $b \leftarrow 2$   
**for**  $i$  **from** 1 **to** 3  
    **for**  $j$  **from** 1 **to** 2  
        **if**  $a$  **is even**  
             $b \leftarrow b + a$   
        **else**  
             $a \leftarrow a + j$   
        **end if**  
    **end for**  
**end for**  
**print** ( $a, b$ )

---

---

---

---

---

---

---

b.  $x \leftarrow 3$   
 $y \leftarrow 10$   
**while**  $y > 5$   
    **for**  $j$  **from** 1 **to** 2  
        **if**  $x$  **is even**  
             $y \leftarrow y - j$   
        **else**  
             $x \leftarrow x + 1$   
        **end if**  
    **end for**  
**end while**  
**print** ( $x, y$ )

---

---

c.  $p \leftarrow 2$   
 $q \leftarrow 8$   
for  $j$  from 1 to 3  
    for  $k$  from 1 to 2  
        if  $q$  is even  
             $p \leftarrow p + k$   
             $q \leftarrow q - 1$   
        else  
             $q \leftarrow q - p$   
        end if  
    end for  
end for  
print  $(p, q)$

## Sub-Section [2.7.2]: Evaluate and Understand the Pseudocode for Different Implementations of Newton's Method

### Question 4

An implementation of Newton's method is shown below.

```

define newton( $f(x)$ ,  $x_0$ ,  $n$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
  for  $i$  from 1 to  $n$  do
    if  $df(x_0) = 0$  then
      return "Error: Division by zero"
    else
       $x_0 \leftarrow x_0 - \frac{f(x_0)}{df(x_0)}$ 
    end if
  end while
  return  $x_0$ 
  
```

Consider calling the function  $\text{newton}(x^2 - 3, 2, 3)$ .

- a. How many iterations are performed?

---

---

- b. What is the final value of  $x_0$ . Give your answer correct to three decimal places.

---

---

---

---

Space for Personal Notes

### Question 5

An implementation of Newton's method is shown below.

```

define newton( $f(x), x_0, n, tol$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
 $i \leftarrow 0$ 
 $x_n \leftarrow x_0$ 
while  $i < n$  do
    if  $df(x_n) = 0$  then
        return "Error: Division by zero"
     $x_{n+1} \leftarrow x_n - \frac{f(x_n)}{df(x_n)}$ 
    if  $-tol < x_{n+1} - x_n < tol$  then
        return  $x_{n+1}$ 
     $x_n \leftarrow x_{n+1}$ 
     $i \leftarrow i + 1$ 
end while
return  $x_n$ 
    
```

Consider calling the function newton ( $x^3 - x^2 + 1, 2, 30, 0.001$ ).

- a. Find the final return value. Give your answer correct to four decimal places.

---

---

---

---

---

---

---

- b. State the value of  $i$  when the algorithm terminates.

---

---

---

---

### Question 6

An implementation of Newton's method is shown below.

```

define newton( $f(x), x_0, n, tol$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
 $i \leftarrow 0$ 
 $x_n \leftarrow x_0$ 
while  $i < n$  do
    if  $df(x_n) = 0$  then
        return "Error: Division by zero"
     $x_{n+1} \leftarrow x_n - \frac{f(x_n)}{df(x_n)}$ 
    if  $-tol < x_{n+1} - x_n < tol$  then
        return  $x_{n+1}$ 
     $x_n \leftarrow x_{n+1}$ 
     $i \leftarrow i + 1$ 
end while
return  $x_n$ 
    
```

Consider calling the function.

- a. Find the final return value of newton ( $x^3 - 5x^2 + 1, 1, 2, 0.01$ ).

---

---

---

---

---

---

---

- b. The function newton ( $x(x + 2)(x - 2), \frac{2}{\sqrt{5}}, 2000, 0.0001$ ) is called. Find the final return value.

---

---

---

---

## Sub-Section: The 'Final Boss'

### Question 7

- a. Consider the pseudocode shown below. Determine the final values of  $m$  and  $n$ .

```

 $m \leftarrow 2$ 
 $n \leftarrow 3$ 
for  $i$  from 1 to 3
  for  $j$  from 1 to 2
    if  $m + n > 5$ 
       $m \leftarrow m + j$ 
       $n \leftarrow n - 1$ 
    else
       $m \leftarrow m + 2$ 
       $n \leftarrow n + 1$ 
    end if
  end for
end for
print( $m, n$ )

```

---

---

---

---

---

---

b. An implementation of Newton's method is shown below.

```

define newton( $f(x)$ ,  $x_0$ ,  $n$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
  for  $i$  from 1 to  $n$  do
    if  $df(x_0) = 0$  then
      return "Error: Division by zero"
    else
       $x_0 \leftarrow x_0 - \frac{f(x_0)}{df(x_0)}$ 
    end if
  end while
  return  $x_0$ 

```

The call  $\text{newton}(\sin(x), x_0, 10)$  is made.

State all values of  $x_0$  for which the function returns an error.

---

---

---

---

- c. The bisection algorithm is a method for approximating solutions to the equation  $f(x) = 0$ . As inputs, the algorithm takes a function  $f$ , an interval  $[a, b]$  which should contain a root of  $f$ , and a tolerance  $\epsilon$ , which the approximate solution is within of the exact solution. Pseudocode is shown below:

```

define Bisection ( $f, a, b, \epsilon$ )
    if  $f(a) \times f(b) \geq 0$ 
        print("Bisection method fails.")
        return None
    end if
    while  $|b - a| > 2\epsilon$ 
         $m \leftarrow \frac{a+b}{2}$ 
        if  $f(m) = 0$ 
            return  $m$ 
        end if

        if  $f(a) \times f(m) < 0$ 
             $b \leftarrow m$ 
        else
             $a \leftarrow m$ 
        end if
    end while

    return  $\frac{a+b}{2}$ 

```

- i. What happens when we call Bisection ( $x^3 + 3x + 5, -4, -2, 0.01$ ).

---

---

---

---

ii. Find the return value of Bisection ( $x^3 + 3x + 5, -2, -1, 0.01$ ).

---

---

---

---

---

---

---

---

## Section B: Supplementary Questions

### Question 8

The following pseudocode segments each print a value. Write down the value that is printed.

a.  $x \leftarrow 8$   
**if**  $x > 5$   
     $x \leftarrow x - 3$   
**end if**  
**print**( $x$ )

---

---

b.  $y \leftarrow 4$   
**if**  $y < 3$   
     $y \leftarrow y + 6$   
**else**  
     $y \leftarrow y - 1$   
**end if**  
**print** ( $y$ )

---

---

c.  $z \leftarrow 2$   
**while**  $z < 6$   
     $z \leftarrow z + 2$   
**end while**  
**print** ( $z$ )

---

---

Space for Personal Notes

**Question 9**

The following pseudocode segments each print a value. Write down the value that is printed.

**a.**  $a \leftarrow 2$   
**for**  $i \leftarrow 1$  **to** 4  
    **if**  $a$  is even  
         $a \leftarrow a + 3$   
    **else**  
         $a \leftarrow a + 2$   
    **end if**  
**end for**  
**print**( $a$ )

---

---

---

---

**b.**  $b \leftarrow 10$   
**while**  $b > 4$   
    **if**  $b$  is even  
         $b \leftarrow b - 2$   
    **else**  
         $b \leftarrow b - 3$   
    **end if**  
**end while**  
**print**( $b$ )

---

---

---

---

```
c.  $c \leftarrow 1$ 
  for  $j \leftarrow 1$  to 5
    if  $j$  is even
       $c \leftarrow c + 2$ 
    else
       $c \leftarrow c + 4$ 
    end if
  end for
  print( $c$ )
```

---

---

---

---

Space for Personal Notes

**Question 10**

The following pseudocode segments each print values. Write down the values that are printed.

```

a.   $a \leftarrow 2$ 
     $b \leftarrow 3$ 
    for  $i$  from 1 to 2
      for  $j$  from 1 to 3
        if  $a$  is even
           $b \leftarrow b + j$ 
           $a \leftarrow a + 1$ 
        else
           $a \leftarrow a + 2$ 
        end if
      end for
    end for
    print( $a, b$ )

```

---

---

---

---

---

---

b.  $x \leftarrow 5$   
 $y \leftarrow 12$   
**while**  $y > 6$   
    **for**  $j$  **from** 1 **to** 3  
        **if**  $x$  **is even**  
             $y \leftarrow y - 2$   
        **else**  
             $x \leftarrow x + 1$   
        **end if**  
    **end for**  
**end while**  
**print**( $x, y$ )

---

---

---

---

---

---

c.  $p \leftarrow 1$   
 $q \leftarrow 10$   
**for**  $j$  **from** 1 **to** 4  
    **for**  $k$  **from** 1 **to** 2  
        **if**  $q$  **is even**  
             $p \leftarrow p + k$   
             $q \leftarrow q - 2$   
        **else**  
             $q \leftarrow q - 1$   
        **end if**  
    **end for**  
**end for**  
**print**( $p, q$ )

---

---

## Sub-Section [2.7.1]: Evaluate and Understand the Pseudocode for Different Implementations of Newton's Method

### Question 11

An implementation of Newton's method is shown below.

```

define newton( $f(x)$ ,  $x_0$ ,  $n$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
for  $i$  from 1 to  $n$  do
    if  $df(x_0) = 0$  then
        return "Error: Division by zero"
    else
         $x_0 \leftarrow x_0 - \frac{f(x_0)}{df(x_0)}$ 
    end if
end while
return  $x_0$ 
    
```

Consider calling the function newton ( $x^2 - 5, 2, 5$ ).

- a. How many iterations are performed?

---

---

- b. What is the final value of  $x_0$ . Give your answer correct to four decimal places.

---

---

---

---

Space for Personal Notes

### Question 12

An implementation of Newton's method is shown below.

```

define newton( $f(x), x_0, n, tol$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
 $i \leftarrow 0$ 
 $x_n \leftarrow x_0$ 
while  $i < n$  do
    if  $df(x_n) = 0$  then
        return "Error: Division by zero"
     $x_{n+1} \leftarrow x_n - \frac{f(x_n)}{df(x_n)}$ 
    if  $-tol < x_{n+1} - x_n < tol$  then
        return  $x_{n+1}$ 
     $x_n \leftarrow x_{n+1}$ 
     $i \leftarrow i + 1$ 
end while
return  $x_n$ 
    
```

Consider calling the function newton ( $x^3 - x^2 + 5, 2, 30, 0.0001$ ).

- a. Find the final return value. Give your answer correct to four decimal places.

---

---

---

---

---

---

---

- b. State the value of  $i$  when the algorithm terminates.

---

---

---

---

### Question 13

An implementation of Newton's method is shown below.

```

define newton( $f(x), x_0, n, tol$ ):
 $df(x) \leftarrow$  the derivative of  $f(x)$ 
 $i \leftarrow 0$ 
 $x_n \leftarrow x_0$ 
while  $i < n$  do
    if  $df(x_n) = 0$  then
        return "Error: Division by zero"
     $x_{n+1} \leftarrow x_n - \frac{f(x_n)}{df(x_n)}$ 
    if  $-tol < x_{n+1} - x_n < tol$  then
        return  $x_{n+1}$ 
     $x_n \leftarrow x_{n+1}$ 
     $i \leftarrow i + 1$ 
end while
return  $x_n$ 
    
```

Consider calling the function.

- a. Find the final return value of newton ( $x^3 - 2x^2 + 4, 1, 2, 0.001$ ).

---

---

---

---

---

---

---

- b. The function newton ( $x(x + 7)(x - 7), \frac{7}{\sqrt{5}}, 5001, 0.0001$ ) is called. Find the final return value.

---

---
