Section A: Recap of Graph Theory I

Cheat Sheet

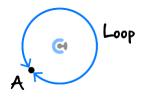

[5.3.1] - Graph theory fundamentals - vertices, edges, degree, adjacency lists and matrices

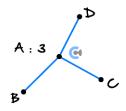

Vertices and Edges

- A graph consists of a set of points called vertices and a set of unordered pairs of vertices, called edges.
- Loops

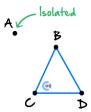

- Loop is an edge which connects to the same vertex.
- Degree of a Vertex

Degree of a vertex is the number of connected to the vertex.

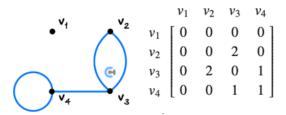

Isolated Vertex

- G Isolated vertex has no edges connected to it.
- lts degree is equal to ______.
- Adjacency Lists

Graph	Adjacency List
	$ A \to (B, D, D, E) $
A B	$ B \to (A, E) $
E	$ C \to (C, D) $
√	$ D \to (A,A,C) $
	$ E \to (A,B) $

- Adjacency list contains all the vertices a given vertex is connected to.
- If the point is connected multiple times, we write the vertex multiple times.
- If a point is looped with itself, we write the vertex to be adjacent to itself.
- Adjacency Matrix

A matrix that represents the vertices and edges that connect the vertices of a graph.

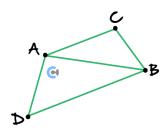

Cheat Sheet

[5.3.2] - Types of graphs

Simple Graph

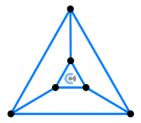

- A simple graph is one in which pairs of vertices are connected by ______.
- The Complement of a Simple Graph

Simple Graph	The Complement
B C C	A E C

Complement of $G = \overline{G}$

- The complement of a simple graph contains the same set of vertices.
- But it contains a complementary set of edges. (Edges that the original graph does not have.)
- Regular Graphs

- Regular graph has all its vertices with the same
- If each vertex has a degree r then the graph is "regular of degree r" or "r-regular".

Number of Edges and Degree of All Vertices of a Regular Graph

Number of Edges \times 2 = Total Degree of all Vertices

- The above result is commonly known as the Handshake Lemma.
- \blacktriangleright Complete Graph (K_n)

<u>K</u> 4.	<u>K</u> 5	<u>K</u> 6
A B B C	A Ge D	A C C D

- A complete graph is a simple graph in which each vertex is connected to every other vertex.
- A complete graph is denoted by K_n , where n is the number of vertices in the graph.
- A complete graph is a type of regular graph.
- \bullet For K_n :

Number of Edges for Complete Graph = _____

Connected Graphs

Connected Graph	<u>Disconnected Graph</u>
A (e) D	A D E F

- A connected graph is a graph where it is possible to reach all vertices by moving along edges.
- A graph that is not connected is called a disconnected graph.

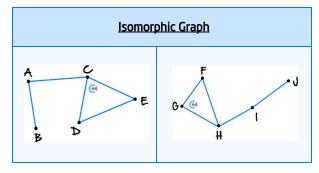

Cheat Sheet

[5.3.3] - Isomorphisms and subgraphs

Isomorphism

- Two graphs are **isomorphic** if their vertices and edges differ only by how they are named.
- G Checklist for Determining Isomorphism
 - Are the number of vertices the same in each graph?
 - Are the numbers of edges the same in each graph?
 - Check that the degrees of each vertex match for both graphs.
 - Label each vertex on both graphs and check if there is a correspondence between the vertices.

Subgraphs

Original Graph	Subgraph
A D D	B C E

- A subgraph is a graph whose vertices and edges are all contained within the original graph.
- A subgraph can be created by removing edges and vertices from the original graph.

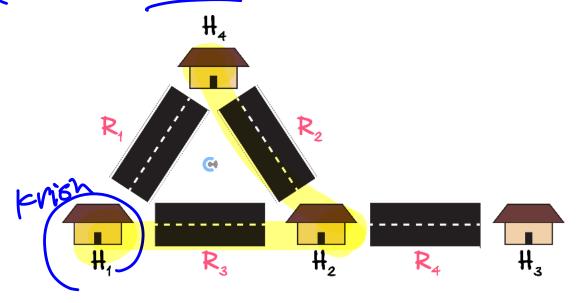

Section B: Walk of a Graph (12D)

Sub-Section: Walk of a Graph

Analogy: Walk of a Graph

Krish goes around the Contour village.

He starts from H_1 and visits H_2 then H_4 .

How can we describe Krish's path?

We can describe his path with the houses he visited and the road he took.

Walk of a Graph

$$v_1, e_1, \cdots, v_{n-1}, e_1, v_n$$

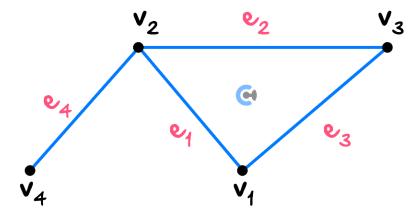

- Alternates between a vertex and an edge.

Question 1

Consider the graph below:

State the walk that visits all vertices once, starting with v_1 and ending with v_4 . (Vertices do not have to be in an ascending order.)

V1, 8/3, V3, 8/2, V2, 84, V4

<u>Discussion:</u> Did we need to write the edges for the previous question?

Sub-Section: Length of a Walk

<u>Discussion:</u> How many edges did we have to go through for the previous question?

3.

This is called the length of a walk!

Length of a Walk

Length of a Walk = Number of Edges in a Walk

- Number of edges in a walk.
- If we use the same edge multiple times, we count it multiple times for the length.

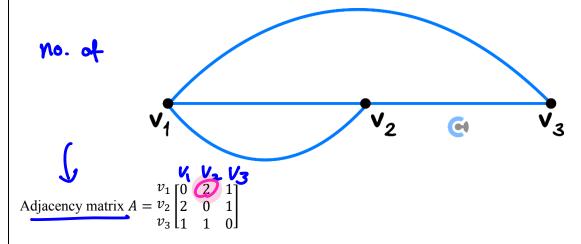

Question 2 Walkthrough.

Consider a graph and its adjacency matrix.

a. State the number of walks of length 1 from v_1 to v_2 .

b. State the element of the adjacency matrix: $A_{1,2}$.

c. Hence, what do you notice?

Number of Walks with the Length of 1

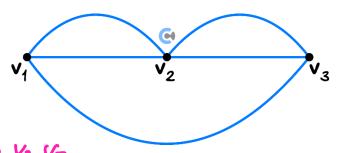

$$A = \begin{bmatrix} v_1, v_1 & v_1, v_2 & v_1, v_3 \\ v_1, v_2 & v_2, v_2 & v_2, v_3 \\ v_1, v_3 & v_3, v_2 & v_3, v_3 \end{bmatrix}$$

The element gives the number of walks of length 1 between two vertices.

Question 3

Consider a graph and its adjacency matrix:

Adjacency matrix $A = \begin{bmatrix} v_1 & 0 & 2 & 1 \\ v_2 & 2 & 0 & 2 \\ v_3 & 1 & 2 & 0 \end{bmatrix}$

Find the number of walks of length 1 between:

a. v_1 and v_2 .

2

b. v_2 and v_3 .

2

c. v_1 and v_3 .

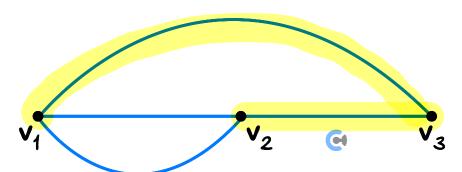

Let's now consider walks of length 2.

Question 4

Consider a graph and its adjacency matrix:

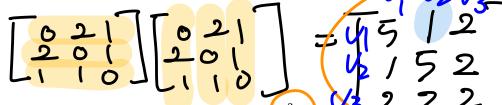

Adjacency matrix
$$A = \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} \begin{bmatrix} 0 & 2 & 1 \\ 2 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}$$

a. State the number of walks of length 2 from v_1 to v_2 .

(walk

(length 2)

b. Find A^2 .

c. State the element of the adjacency matrix $A_{1,2}^2$.

d. Hence, what do you notice?

n is the length of

Number of Walks with the Length of n

$$A^n = \begin{bmatrix} v_1, v_1 & v_1, v_2 & v_1, v_3 \\ v_1, v_2 & v_2, v_2 & v_2, v_3 \\ v_1, v_3 & v_3, v_2 & v_3, v_3 \end{bmatrix}$$

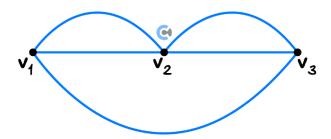

- For a walk of length n, we power the adjacency matrix by _____.
- \blacktriangleright The element gives the number of walks of length n between two vertices.

Space for Personal Notes

CONTOUREDUCATION

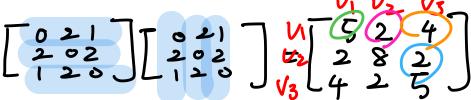

Question 5

Consider a graph and its adjacency matrix:

Adjacency matrix $A = \begin{bmatrix} v_1 & 0 & 2 & 1 \\ v_2 & 2 & 0 & 2 \\ v_3 & 1 & 2 & 0 \end{bmatrix}$

a. Find 2 Longh 2

b. Find the number of walks of length 2 between v_1 and itself.

5

c. Find the number of walks of length 2 between v_1 and v_2 .

d. Find the number of walks of length 2 between v_2 and v_3 .

2

e. Find the number of walks of length 2 between v_1 and v_3 .

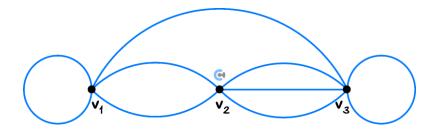

Exploration: Counting the Number of Walks from the Adjacency Matrix

Consider the following graph with the following adjacency matrix:

$$\begin{aligned} \text{Adjacency Matrix} &= \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(v_1 \rightarrow v_3) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(v_3 \rightarrow v_3) \end{bmatrix} \end{aligned}$$

 \blacktriangleright How many ways are there to go from v_1 to v_3 with the length of 2?

State the possible order of the vertices we can go through.

$$v_1
ightarrow v_1
ightharpoonup v_3$$
 $v_1
ightharpoonup v_2
ightharpoonup v_3$
 $v_1
ightharpoonup v_3
ightharpoonup v_3$

The number of ways to achieve each path would be a multiple of what two numbers?

$$n(v_1 - v_2) \rightarrow v_3) = n(V_1 \rightarrow V_1) \times n(V_1 \rightarrow V_3)$$

$$n(v_1 - v_2) \rightarrow v_3) = n(V_1 \rightarrow V_2) \times n(V_2 \rightarrow V_3)$$

$$n(v_1 \rightarrow v_2 \rightarrow v_3) = n(V_1 \rightarrow V_2) \times n(V_3 \rightarrow V_3)$$

Now let's consider our adjacency matrix squared.

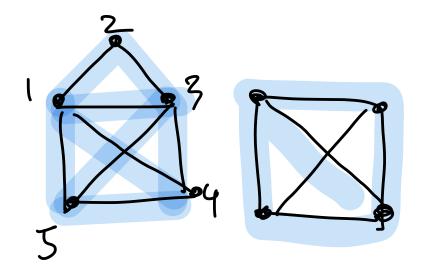

$$\begin{bmatrix} n(V_1 \rightarrow V_1) & n(V_1 \rightarrow V_2) & n(V_1 - V_3) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_1 \rightarrow V_1) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_1 \rightarrow V_1) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_1 \rightarrow V_1) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_1 \rightarrow V_1) \\ n(v_2 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_2 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_3 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_3 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_2 \rightarrow v_2) & n(V_3 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_3 \rightarrow V_3) \\ n(v_3 \rightarrow v_1) & n(v_3 \rightarrow v_2) & n(V_3 \rightarrow V_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_1) & n(v_1 \rightarrow v_2) & n(V_3 \rightarrow V_3) \\ n(v_1 \rightarrow v_2) & n(v_2 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_2) & n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_2) & n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_2) & n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_3) & n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) & n(v_3 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \end{bmatrix} . \begin{bmatrix} n(v_1 \rightarrow v_3) & n(v_2 \rightarrow v_3) & n(v_3 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) \\ n(v_3 \rightarrow v_3) & n(v_3 \rightarrow v_3) & n(v_$$

CONTOUREDUCATION

What do we get when we combine the first row of the first matrix (v_1) and the third column of the second matrix (v_3) ?

$$n(\rightarrow) \times n(\rightarrow) + n(\rightarrow) \times n(\rightarrow) + n(\rightarrow) \times n(\rightarrow)$$

What do you notice?

Section C: Euler Trail and Circuits (12B)

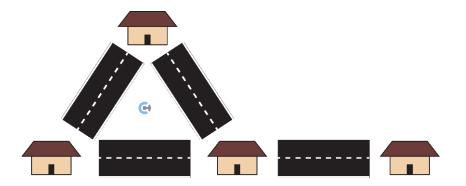

Sub-Section: Definition of Euler Trails

Analogy: Understanding Euler Trails

Krish is faced with a dilemma.

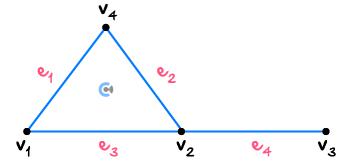

How do I cover all the roads exactly once?

Is that even possible?

- ➤ What Krish is trying to achieve is called **Euley**. **fra** `N
- Euler Trail is a walk of a graph where all the edges (roads) are used exactly once.

Euler Trail

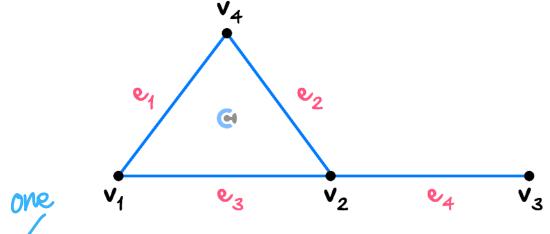

- Euler Trail is a walk of a graph where all the edges are used exactly once.
- Whether a vertex is used exactly once is irrelevant.

Question 6 Walkthrough.

Consider a graph with an Euler trail.

State all possible Euler trails.

V384V2 83 V1 8 V4 82 V2

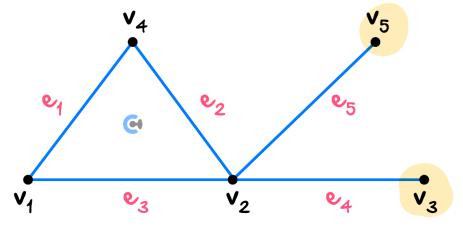

NOTE: A vertex can be visited twice. We are focusing on the edge being used exactly once.

Consider a graph with an Euler trail.

State all possible Euler trails.

V5V2V4 V1 V2 V3

Sub-Section: Identifying Whether a Graph has an Euler Trail

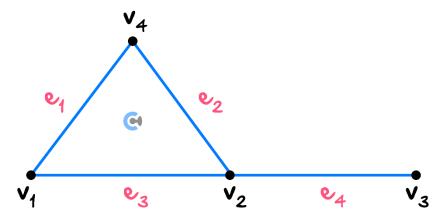

Let's take a look at how we can tell if a graph has an Euler trail!

Existence of an Euler Trail

OR

- A graph needs to satisfy one of the following two rules:
 - 1. Every vertex has an even degree.

2. Exactly two vertices have an odd degree.

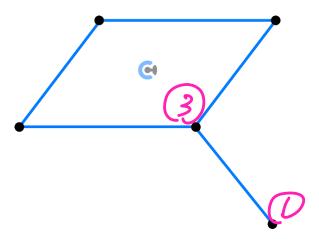

Question 8 Walkthrough.

Consider the graph below and state whether or not it will have an Euler trail.

Euler trail

TIP: This can get very confusing. Always write down the degree of each vertex first.

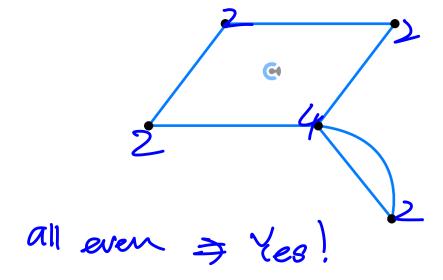

CONTOUREDUCATION

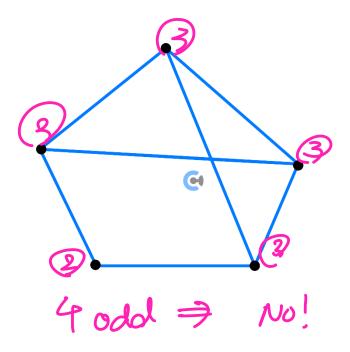

Question 9

Consider the graphs below and state whether or not they will have an Euler trail.

a.

b.

Sub-Section: Finding Euler Trails Efficiently

Is there any more efficient way of finding the Euler trail?

Fleury's Algorithm

Definition

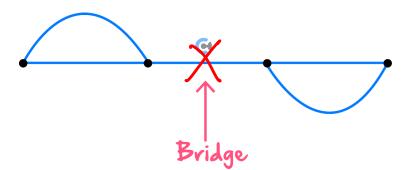

- Allows us to find Euler's trail efficiently in graphs with Euler trails.
- The steps are as follows:
 - 1. If there a<mark>re two vertices of odd degrees, then</mark> start from one of them. Otherwise, start from any vertex.
 - 2. Move from the current vertex across an edge to an adjacent vertex. Always choose a non-bridge edge unless there is no alternative.
 - **3.** Delete the edge that you have just traversed.
 - **4.** Repeat from Step 2 until there are no edges left.

Wait, what's a bridge?

Bridge

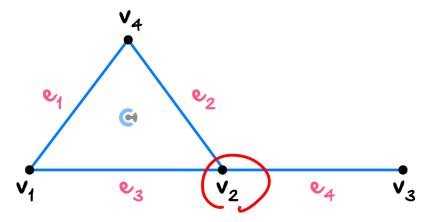

A bridge is an edge that, if you delete it, will cause a graph to be cut into two graphs.

Question 10 Walkthrough.

Consider a graph with an Euler trail.

State any possible Euler trail using Fleury's algorithm.

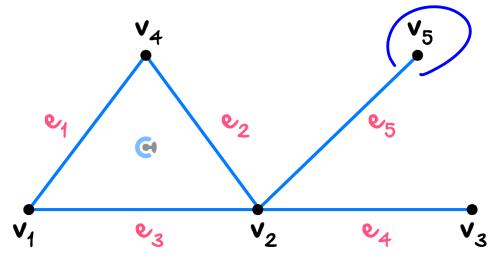

NOTE: A vertex can be visited twice. We are focusing on the edge being used exactly once.

Question 11

Consider a graph with an Euler trail.

State any possible Euler trail using Fleury's algorithm.

odd V5 V2 V4 V1 V2 V3

NOTE: Hope you got the same answer as before!

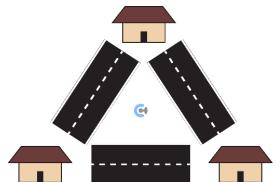

Sub-Section: Definition of Euler Circuit

Analogy: Understanding Euler Circuits

Krish is back with his dilemma.

Story & end are the same vertex

How do I cover all the roads exactly once?

Is that even possible?

Krish realises his mum wants him to also come back home!

And now asks the question,

AND come back to the same position at the start?

Krish now wants to form an Euler trail that also comes back to the same starting point.

Discussion: Is the Euler circuit still an Euler trail?

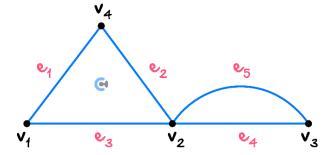

Euler Circuits

Euler Circuit is a walk of a graph where all the edges are used exactly once.

Starting vertex and ending vertex must be the Save

Vertice 9

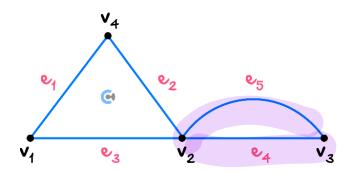

Whether a vertex is used exactly once is irrelevant.

are av

Euler circuits are a ________ of Euler trails.

Question 12 Walkthrough.

Consider a graph with an Euler circuit:

State a possible Euler circuit.

V1, V4, V2, en, V3, e4V2, V1

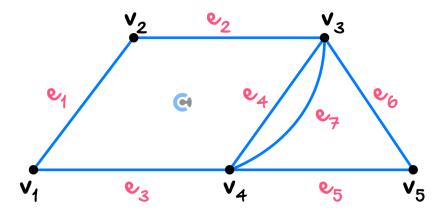

NOTE: We must come back to the same position.

Question 13

Consider a graph with an Euler circuit:

State a possible Euler circuit.

Discussion: Does every graph have a valid Euler circuit?

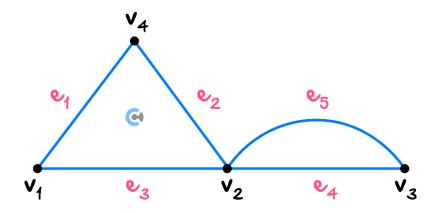

Let's take a look at how we can tell if a graph has an Euler circuit!

Existence of an Euler Circuit

- A graph needs to satisfy the following rule:
 - Every vertex has an even degree.

NOTE: It's simply the first condition of the Euler trail (but not the second).

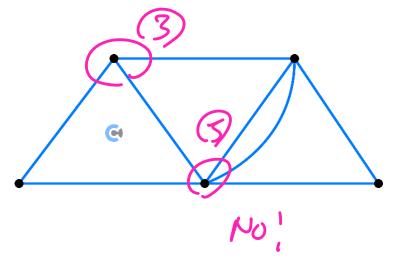

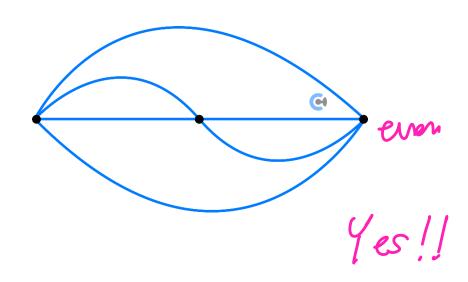

Question 14

Consider the graphs below and state whether or not they will have an Euler circuit.

a.

b.

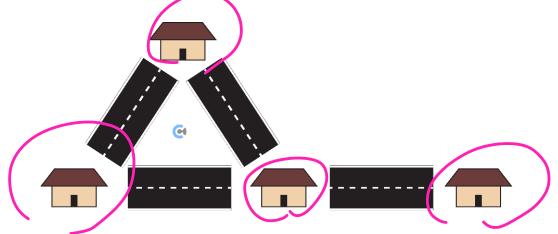

Section D: Hamiltonian Paths and Cycles (12C)

Sub-Section: Definition of Hamiltonian Paths

Analogy: Understanding Hamiltonian Paths

Krish is faced with a dilemma.

How do I cover all the houses exactly once?

Is that even possible?

- What Krish is trying to achieve is called Hamiltonion. Poth
- Hamiltonian path is a walk of a graph where all the vertices(houses) are used exactly once.

NOTE: Similar to Euler, but we are now looking at vertices instead of edges.

Hamiltonian Path

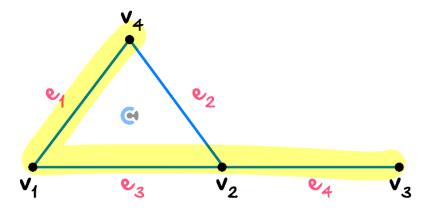

A path that covers all the vertices exactly once.

Question 15 Walkthrough.

Consider a graph with a Hamiltonian path:

State any possible Hamiltonian path.

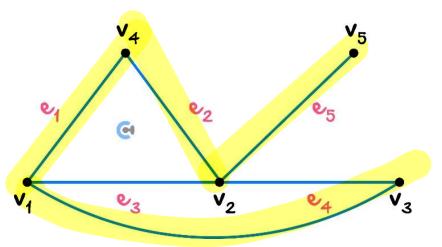

NOTE: An edge can be visited twice. We are focusing on the vertex being visited exactly once.

Question 16

Consider a graph with a Hamiltonian path:

State any possible Hamiltonian path.

V5, V4, V4, V1, V3

Sub-Section: Definition of Hamiltonian Cycles

Discussion: What do you think the Hamiltonian cycle means?

Every vertex once Start & end

> Ly This one is twice

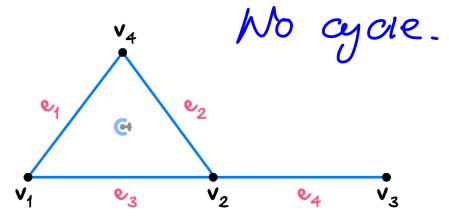

Hamiltonian Cycle

A path which covers all the vertices exactly once (Except the starting one).

The starting position and ending vertex must be identical.

Question 17 Walkthrough.

Consider the graph below:

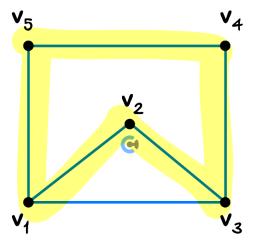

Does it have a Hamiltonian cycle? If so, state below.

Consider the graph below:

Does it have a Hamiltonian cycle? If so, state below.

Yes

13, V2 V1, V5, V4 N3

Section E: Trees

Sub-Section: Definition of Trees

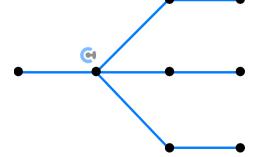

REMINDER: Connected Graphs

Connected Graph	<u>Disconnected Graph</u>
A CO F	A D D E F

A connected graph is a graph where it is possible to reach all vertices by moving along edges.

<u>Trees</u>

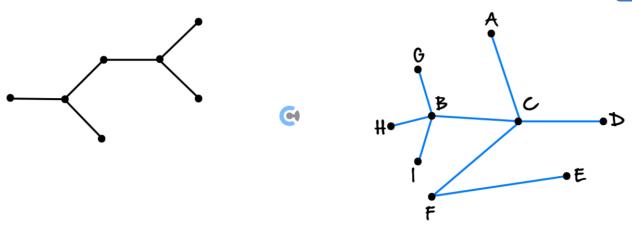

- A tree is a connected graph (can go from one vertex to any other vertex) without any cycle.
- We cannot come back to the same vertex by not repeating the edges.

CONTOUREDUCATION

Trees

- A tree is a connected graph (can go from one vertex to any other vertex) without any cycle.
- We cannot come back to the same vertex by not repeating the edges.
- Equivalent conditions for a tree:
 - A simple graph with n vertices is a tree if ANY of the following conditions are met:

Tt is **Comerced** and contains NO cycles.

> It is Connected and has (n-1) edges

lt has n = n + 1 and has (n-1) edges.

It is <u>connected</u> but would become <u>disconnected</u> if any edge is <u>remove</u>

It is work and would form a would for wo

Any 2000 are connected by only a path.

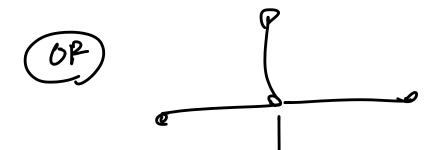

Question 19 Walkthrough.

Sketch any tree that contains five vertices.

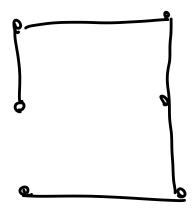

Question 20

Sketch any tree that contains six vertices.

Sub-Section: Spanning Tree

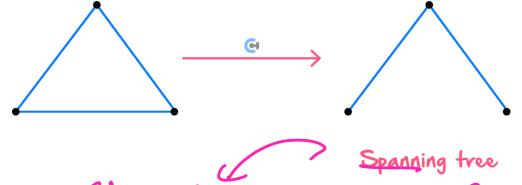

What is a spanning tree?

Spanning Trees

- Spanning trees are <u>Sub-graph</u> and retain all of the <u>vertices</u> of the original graph.
 - The original graph does not have to be a tree.

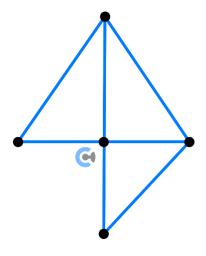

NOTE: The cycle goes through all the points and comes back to the same point.

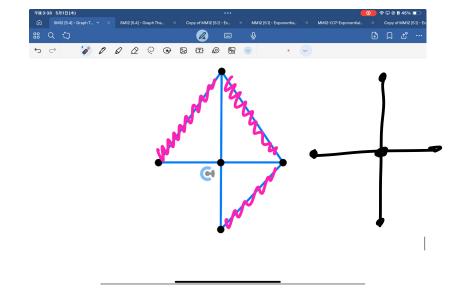

Question 21 Walkthrough.

Find the spanning tree for the given graph below:

Is there a systematic way to find a spanning tree for harder questions?

Definition

Algorithm for Finding a Spanning Tree

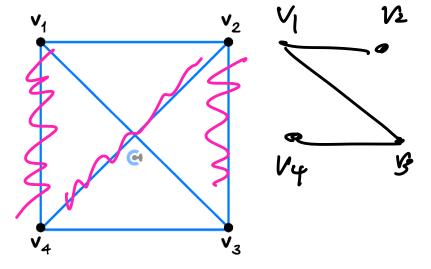

Spanning tree

- The steps in finding a spanning tree:
 - 1. If the graph has no cycles, then stop.
 - 2. Choose any edge that belongs to a cycle, and delete the chosen edge.
 - 3. Repeat from 1.

Question 22 Walkthrough.

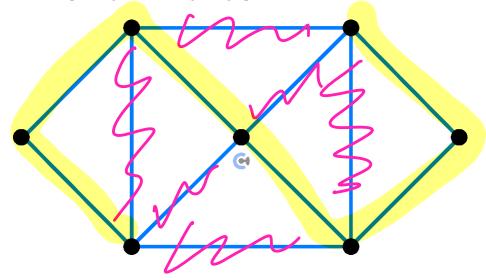

Using the algorithm, find a spanning tree for the given graph below:

Question 23 (4 marks) Walkthrough.

Using the algorithm, find a spanning tree for the given graph below:

Cheat Sheet

[5.4.1] - Walk of a graph

Walk of a Graph

$$v_1, e_1, \cdots, v_{n-1}, e_1, v_n$$

- Order of the vertices (points) and edges (lines) we are visiting.
- Alternates between a vertex and an edge.
- If there is only one edge between two vertices, stating that an edge can be abbreviated.

Length of a Walk

Length of a Walk = Number of Edges in a Walk

- Number of edges in a walk.
- If we use the same edge multiple times, we count it multiple times for the length.

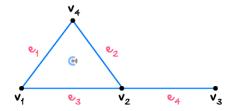

Number of Walks with the Length of *n*

$$A^n = \begin{bmatrix} v_1, v_1 & v_1, v_2 & v_1, v_3 \\ v_1, v_2 & v_2, v_2 & v_2, v_3 \\ v_1, v_3 & v_3, v_2 & v_3, v_3 \end{bmatrix}$$

- For a walk of length n, we power the adjacency matrix by n.
- The element gives the number of walks of length *n* between two vertices.

[5.4.2] - Euler trail and circuits

Euler Trail

- Euler Trail is a walk of a graph where all the edges are used exactly once.
- Whether a vertex is used exactly once is irrelevant.

Existence of an Euler Trail

- A graph needs to satisfy one of the following two rules:
 - 1. Every vertex has an even degree.

OR

2. Exactly two vertices have an odd degree.

Fleury's Algorithm

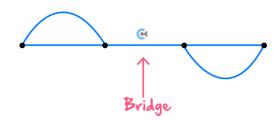

- Allows us to find Euler's trail efficiently in graphs with Euler trails.
- The steps are as follows:
 - 1. If there are two vertices of odd degrees, start from one. Otherwise, start from any vertex.
 - 2. Move from the current vertex across an edge to an adjacent vertex. Always choose a non-bridge edge unless there is no alternative.
 - **3.** Delete the edge that you have just traversed.
 - **4.** Repeat from Step 2 until there are no edges left.

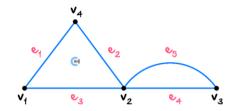

Cheat Sheet

Bridge

- A bridge is an edge that, if you delete it, will cause a graph to be cut into two graphs.
- Euler Circuits

Euler Circuit is a walk of a graph where all the edges are used exactly once.

The starting vertex and ending vertex must be the same

- Whether a vertex is used exactly once is irrelevant.
- Euler circuits are a subset of Euler trails.
- Existence of an Euler Circuit
 - A graph needs to satisfy the following rule:
 - Every vertex has an even degree.

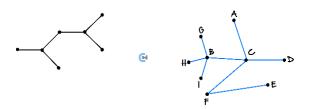

[5.4.3] - Hamiltonian Paths and Cycles

- Hamiltonian Path
 - A path that covers all the vertices exactly once.
- Hamiltonian Cycle
 - A path that covers all the vertices exactly once. (Except the starting one.)

The starting position and ending vertex must be identical.

[5.4.4] - Trees

Trees

- A tree is a connected graph (can go from one vertex to any other vertex) without any cycle.
- We cannot come back to the same vertex by not repeating the edges.
- Equivalent Conditions for a Tree
 - A simple graph with *n* vertices is a tree if ANY of the following conditions are met:
 - lt is connected and contains no cycles.
 - lt is connected and has (n-1) edges.
 - ightharpoonup It has no cycles and has (n-1) edges.
 - It is connected but would become disconnected if any edge is removed.
 - It is connected and would form a cycle if any edge is added.
 - Any two vertices are connected by only a single path.
