Question 6

- a. Consider the following paragraph.

Australian scientists in the forefront of medical research

Much research is taking place in Australia into the field of Proteomics. Proteomics is the large scale study of the proteins present in a living organism. The DNA of a cell provides the blueprint for the assembly of the primary structure of proteins, the large biomolecules essential to life. In humans, at any one time, there may be as many as 1 000 000 different proteins and it is those proteins that do all the real work such as providing structure to skin, digesting food and fighting infections. So significant is the role of proteins in living things that considerable resources are invested into identifying proteins as markers for disease.
