Students in a chemistry class were required to design a procedure to determine gravimetrically the concentration of lead(II) ethanoate, $\text{Pb}(\text{CH}_3\text{COO})_2$, in a sample of hair dye. They were instructed to measure the mass of precipitate formed when a sample of the hair dye was added to **either** 0.1 M potassium iodide **or** 0.1 M potassium nitrate.

The students were also provided with the following data.

The solubility of highly soluble, thermally unstable salts such as ammonium chloride may be determined by back titration.

In one experiment a 5.00 mL saturated solution of ammonium chloride, NH_4Cl , at 20.0 °C, was diluted with distilled water to 250.0 mL in a standard flask.

A 20.0 mL aliquot of this solution was added to 10.0 mL of 0.400 M NaOH solution. The solution was heated to drive off the ammonia formed by this reaction.

When the flask had cooled, the excess hydroxide ions were neutralised by 14.7 mL of 0.125 M HCl solution. The molar mass of ammonium chloride is 53.5 g mol^{-1} .

a. i. Write an equation for the neutralisation reaction.

ii. Determine the amount, in mole, of NaOH that was originally added to the ammonium chloride solution.

iii. Determine the amount, in mole, of ammonium chloride in the 20.0 mL aliquot.

iv. Calculate the amount, in mole, of ammonium chloride in 5.00 mL of the saturated solution.

v. Calculate the solubility, in g L^{-1} , of ammonium chloride in water at 20 °C.
