Question 12

a)

b) At low concentrations of NaCl, water is preferentially oxidised and reduced.

Positive electrode (anode): $\text{H}_2\text{O}(\ell) \rightarrow \text{O}_2(\text{g}) + 2\text{H}^+(\text{aq}) + 2\text{e}^-$ ❶

Bubbles are observed because oxygen gas is produced. The litmus paper is red because hydrogen ions are produced (acidic environment). ❶

Negative electrode (cathode):

$\text{H}_2\text{O}(\ell) \rightarrow \text{H}_2(\text{g}) + \text{OH}^-(\text{aq})$ ❶

Bubbles are observed because hydrogen gas is formed. The litmus paper is blue because hydroxide ions are produced (basic environment). ❶

c) An electrolytic cell requires a power source to operate and converts electrical energy into chemical energy. ❶ A galvanic cell operates spontaneously and converts chemical energy into electrical energy. ❶

Question 13

a) Anode $\text{H}_2(\text{g}) + 2\text{OH}^-(\text{aq}) \rightarrow 2\text{H}_2\text{O}(\text{l}) + 2\text{e}^-$ ❶
